CODE:

```
#include<stdio.h>

int main()
{
    int a,b,temp;
    scanf("%d %d",&a,&b);
    temp=a;
    a=b;
    b=temp;
    printf("%d %d",a,b);
}
```

```

```
    int m,p,c,t;
```

```
    scanf("%d %d %d",&m,&p,&c);
```

```
    t=m+p+c;

2) Assume you are an awesome parent and want to give your children some cookies. But, you should give each child at most one cookie.

Each child  $i$  has a greed factor  $g[i]$ , which is the minimum size of a cookie that the child will be content with; and each cookie  $j$  has a size  $s[j]$ . If  $s[j] \geq g[i]$ , we can assign the cookie  $j$  to the child  $i$ , and the child  $i$  will be content. Your goal is to maximize the number of your content children and output the maximum number.

Example 1:

Input:

3

1 2 3

2

1 1

Output:

1

Explanation: You have 3 children and 2 cookies. The greed factors of 3 children are 1, 2, 3.

And even though you have 2 cookies, since their size is both 1, you could only make the child whose greed factor is 1 content.

You need to output 1.

Constraints:

$1 \leq g.length \leq 3 * 10^4$

$0 \leq s.length \leq 3 * 10^4$

$1 \leq g[i], s[j] \leq 2^{31} - 1$

### CODE:

```
#include<stdio.h>
int main(){
    int chno,cono;
    int satisfied=0,j=0;
    scanf("%d",&chno);
    int child[chno];
    for(int i = 0;i<chno;i++){
        scanf("%d",&child[i]);
    }
    scanf("%d",&cono);
    int cookie[cono];
    for(int i = 0; i<cono;i++){
        scanf("%d",&cookie[i]);
    }
    for(int i=0;i<chno;i++){

**3) Given two strings find the length of the common longest subsequence(need not be contiguous) between the two.**

**Example:**

**s1: ggtabe**

**s2: tgatasb**

**s1                    a           g           g           t           a           b**

**s2                    g           x           t           x           a           y           b**

**The length is 4**

**Solving it using Dynamic Programming**

**For example:**

Input	Result
aab	2
azb	

**CODE:**

```
#include <stdio.h>
#include <string.h>
int lcs(char *s1, char *s2) {
    int m = strlen(s1);
    int n = strlen(s2);
    int dp[m+1][n+1];
    for (int i = 0; i <= m; i++) {
        for (int j = 0; j <= n; j++) {
            if (i == 0 || j == 0) {
                dp[i][j] = 0; // LCS of any string with an empty string is 0
            }
            else if (s1[i-1] == s2[j-1]) {
                dp[i][j] = dp[i-1][j-1] + 1; // Characters match

            }
        }
    }
    return dp[m][n];
}

int main() {
    char s1[100], s2[100];
    scanf("%s %s", s1, s2);
